

CHAPTER-1

INTRODUCTION AND DESIGN OF THE STUDY

1.1 INTRODUCTION:

Job satisfaction is the degree to which individuals like their jobs. Some people enjoy work and find it to be a central part of life. Others hate to work and do so only because they must. This job attitude has been the subject of extensive research in the domain of industrial-organisational psychology and organisational behaviour. A thorough account of the meaning, causes and consequences of this important employee attitude will be presented in this unit. First, the nature of job satisfaction will be discussed highlighting its historical antecedents, meaning and dimensions. Second, some major assessment techniques will be discussed. Third, an account of the antecedents or predictors of job satisfaction will be put forth. Finally, the outcomes of job satisfaction will be examined (www.egyankosh.ac.in)

1.2 DESIGN OF THE STUDY:

Studies on nurses' job satisfaction show that it varies depending on factors like recognition, work security, and opportunities for advancement. Many studies use quantitative methods like surveys and questionnaires to measure satisfaction and identify associated factors, such as demographics or work environment conditions. For example, some research highlights that while nurses may be satisfied with the work itself, they are less satisfied with factors like recognition and professional development opportunities.

1.3 Key factors influencing job satisfaction:

- **Recognition and advancement:** Lack of recognition and limited opportunities for professional growth are major sources of dissatisfaction.
- **Work security:** Having job security is a significant positive factor for job satisfaction.
- **Work environment:** A good work environment, including factors like nurse-to-patient ratios, is strongly associated with higher satisfaction.
- **Demographics:** Factors like age, gender, marital status, and professional qualifications can be associated with job satisfaction levels.

- **Specialization:** Satisfaction levels can differ across nursing specializations; for example, psychiatric or mental health nurses may report higher satisfaction than those in orthopaedics, according to HRSA Health Workforce. Common study designs.
- **Quantitative, cross-sectional studies:** These are a common approach, using surveys to collect data from a sample at a single point in time to assess satisfaction and its correlates, explains this study on PubMed Central.
- **Questionnaire-based surveys:** Many studies use standardized instruments like the Minnesota Job Satisfaction Scale to measure job satisfaction, along with scales for factors like role conflict, stress, and professional commitment, according to this study on PubMed Central.
- **Systematic reviews:** These studies synthesize findings from multiple existing research papers to provide a broader overview of the topic.
- **Longitudinal studies:** Some research follows nurses over time to track changes in job satisfaction and identify trends(www.google.com)

CHAPTER II

THEORETICAL BACKGROUND OF THE STUDY

2.1 Introduction:

Nursing is one of the stressful jobs in health sector. The level of job satisfaction in the profession remains a matter of concern. Globally, there are mounting concerns about nurses' job satisfaction because it's pivotal role in nurse turn over and quality of care of patients. Poor job conditions and limited resources are reducing job satisfaction and motivation among nurses in low-income countries. Here, in this research study, the aim was to discover the job satisfaction among nurses (BSc and General). A group of 60 nurses from Hukkeri taluka , Belagavi district were recruited to participate in the study via a random sampling technique. The data were collected using the IJS (Index of Job Satisfaction) Scale. Result shows that there is no significant difference between BSc and general nurses with regard to their job satisfaction using is a profession within the health care sector focused on the care of individuals, families, and communities so they may attain, maintain or recover optimal health and quality of life. They also take on vital roles of education, assessing situations, as support. Nurses may be differentiated from other health care providers by their approach to patient care, training and scope of practice. Nurses practice in many specialties with differing levels of prescription authority. Nurses comprise the largest component of most health care environments, but there is evidence of an international shortage of qualified nurses. Many nurses provide care within the ordering scope of physicians, and this traditional role has shaped the public image of nurses as care providers. Satisfaction means the simple feeling of attainment of any goal or objective. Job dissatisfaction brings.

2.2 History of Job Satisfaction:

For almost one hundred years, employee job satisfaction has been targeted by research. The origin of these studies dates back to at least 1911, when Taylor began to study employees and their job duties to develop better ways to train workers. By 1927, the study of employee's positive or negative reaction to their jobs had fully begun to take hold when Elton Mayo first studied the effect of lighting at the Western Electric Hawthorne Works in Chicago. These studies showed that lighting had little connection to worker productivity, creating the fundamental groundwork for future studies that asked about other factors that may have an impact on employees. The Hawthorne Studies continued until 1932, and in the five-year interval, the research widened to include factors such as temperature, fatigue, breaks, and working hours. Mayo's work may seem marginally relevant to job satisfaction today, but he discovered that the mere act of studying workers and providing them with more attention increased their motivation and productivity. Mayo had stumbled upon the essence of human motivation, marking a new era of humanistic job satisfaction research, and revolutionising the research and theories of job satisfaction (<https://www.egyankosh.ac.in/>)

2.3 Meaning of Job satisfaction:

In the past hundred years, job satisfaction has been given various definitions by organisational behaviour scholars and researchers. who defined it as “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences More recently, Lambert, Barton, and Hogan (1999) defined the term as “the fulfilment or gratification of certain needs that are associated with one’s work.” Spector (1997) defines it as “the extent to which people like (satisfaction) or dislike (dissatisfaction) their jobs” (<https://www.egyankosh.ac.in/>).

2.4 Definitions of Job satisfaction:

Job Satisfaction refers to the extent to which employees feel content and fulfilled with their jobs. High job satisfaction occurs when the expectations, needs, and desires of an employee align well with what the job provides. However, lack of job satisfaction can lead to disengagement, decreased productivity, and higher turnover rates. This subjective measure is crucial not only for the well-being of employees but also for the health of organizations, as it directly impacts performance and retention. Understanding and enhancing job satisfaction is vital for employers aiming to maintain a motivated, effective, and stable workforce. (<https://www.geeksforgeeks.org/>).

2.5 Factors contributing to job satisfaction:

1. The co-workers:

The people who you work can be either one of two kinds. First, they might be nice friendly people who are sure about their own abilities and are always willing to help you in time of need. Working with such people is not only very easy but it also fun. Overtime such people do not remain simply co-workers, but they become family

2. The boss and management style:

A major factor affecting your job satisfaction is the kind of boss which you have to work under. If your boss is someone who is approachable and listens to whatever grievance you have, then working for him automatically becomes rather pleasurable.

3. The general working environment:

There are many companies which ensure that the work environment of their company is proper as they strongly believe that if the environment is not conducive to work, then employees will not be able to give their best at all times.

4. The facilities you are offered:

Here are many companies which might not be paying their employees a huge salary but they do make up for this, by giving adequate facilities and benefits in order to keep them satisfied. This is indeed one of the major factors that influence employee job satisfaction

5. The workload:

Various individuals join a career path because they believe that they can see themselves doing this for the rest of their lives. They strongly believe that no matter how much responsibility is entrusted to them it will not feel burdensome to them because this is truly where their talent and joy lies..(<https://content.wisestep.com/>)

2.6 Pros of Job Satisfaction:

1. The work you submit will be very good:

One of the major benefits of job satisfaction is that the work which you submit will automatically be of superior quality. This is simply because you love what you do and you are willing to do whatever it takes in order to go from strength to strength.

2. You will be eager to work:

Another major benefit of job satisfaction is that you will be eager to take on new responsibility and your attitude towards your work will be rather positive as well. Your eagerness will help you learn a number of new and interesting things, but in addition to this, it will also help you to take the company to new heights

. 3. You will automatically rise from strength to strength:

A person who has job satisfaction will love his job and will consequently perform all his duties to the best of his abilities. Companies do take note of those employees who are performing all tasks with diligence and it is these hard-working employees who are able to bag promotions and rise from strength to strength.

2.7 Cons of Job Satisfaction:

1. You never want to leave your comfort zone:

Though having job satisfaction is vital in order to help you have a happy professional life, one of the chief limitations of job satisfaction is that you are so content with what you do, that you will eventually refuse to leave your comfort zone.

2. You refuse to challenge yourself:

People who have immense job satisfaction will never be willing to challenge themselves with a daunting task. This is because they are afraid that if they challenge themselves then the job will not remain as satisfying as it was.

CHAPTER-III

REVIEW OF LITERATURE

3.1 Introduction

A literature review is a research paper that includes the current knowledge, including substantive findings and facts, as well as theoretical and methodological contributions to a particular research topic. The review of literature for the instant research provides an overview and clarity of various aspects and issues about the research work already carried out at the national and international level on the nurses' job satisfaction.

The following review of literature can help to draw significant conclusions and a guiding map for this study. Some of the important studies which have been reviewed are as under.

3.2 Review of Related Literature:

Alisha Sager and et al (2024) in their research on “A Study on Job Satisfaction among Nurses” aimed to discover the job satisfaction among nurses (BSc and General). The authors have collected the data from 60 Nurses of the Thrissur district; those are selected randomly. They employed a descriptive research method. They collected the required data with the help of a questionnaire. The research found that there is no significant difference in job satisfaction among nurses who fall in the general category and BSc nursing category.

Bragadóttir H and et al (2023) in their research on “A Study on Job Satisfaction among Nurses” Teamwork is identified as a key contributor to patient safety and good teamwork is recognized as one of the presumptions of healthy work environment in nursing. The importance of job satisfaction in nursing has repeatedly been confirmed, but only recently has the association of job satisfaction and nursing teamwork been identified.

Ozdoba, P and et al (2022) in their research on “A Study on Job Satisfaction among Nurses” The aim of this study was to map and summarize the published research findings on hospital ethical climate and its relationship with nursing staff job satisfaction as well as strategies proposed in the literature for the improvement of hospital ethical climate and job satisfaction through the actions of nursing staff in leadership positions. Three electronic bibliographic databases were searched Furthermore, the interdependence of ethical climate and job satisfaction of nursing staff affects many different aspects including patients, co-workers, an organization and research. Identifying factors that influence ethical climate and job satisfaction as well as the relationship between these variables may help to reduce the dropout concerning a change of profession among nursing staff.

Specchia, M.L and et al (2021) in their research on “A Study on Job Satisfaction among Nurses” Healthcare organisations are social systems in which human resources are the most important factor. Leadership plays a key role, affecting outcomes for professionals, patients and work environment. The aim of this research was to identify and analyse the knowledge present to date concerning the correlation between leadership styles and nurses’ job satisfaction. Passive-avoidant and laissez-faire styles, instead, showed a negative correlation with job satisfaction in all cases. Only the transactional style showed both positive and negative correlation. In this challenging environment, leaders need to promote technical and professional competencies, but also act to improve staff satisfaction and morale

Ola Naiem Al-Fuqaha and et al (2025) in their research on “A Study on Job Satisfaction among Nurses” Job satisfaction among healthcare workers is essential for maintaining high-quality care. Previous research has shown different levels of job satisfaction, but there is no comprehensive list of determinants of job satisfaction among healthcare workers. Two independent reviewers performed data extraction and review using the Critical Appraisal Skills Programme (CASP) quality assessment checklist, workers in GCC: pay, promotion, co-workers, supervision, fringe benefits, contingent rewards, operating conditions, nature of work, communication, workload, leadership style, relation with patients, demographic variables, and others, such as hospital type. Thus, our study expands on Spector’s nine determinants model of job satisfaction, hence providing a wider and more detail insight into job satisfaction in workplace.

CHAPTER IV

RESEARCH METHODOLOGY

4.1 INTRODUCTION

This chapter contains the methods and tools that were used to identify job satisfaction of nurses in public and private hospitals in Hukkeri taluk. The procedure of the research methodology included the selection of right questions, selection of appropriate representative sample, collecting relevant data, applying appropriate research tools and techniques and analysis and interpretation of the data for scientific investigation of the problem. This chapter covers sample size, population for study, a description of the research methods and statistical tools that were used in the study for the collection of data from nurses in both public and private hospitals. The present study has been conducted in Hukkeri taluk to compare the job satisfaction level of nurses in both public and private hospitals of the state. An attempt has been made to know the impact of demographic factors on nurses' job satisfaction in public and private hospitals.

4.2 STATEMENT OF PROBLEM:

Nurses play a crucial role in patient care. Indeed, this profession requires a high level of emotional, mental and physical workload. Improving the well-being of these workers means taking into account the impact of workload on their job satisfaction.

Value of work life is commonly supposed to be one of the most essential influences in recruitment and retention, thus having an effect on the current and the future supply of nurses. Maslow suggested that employees will always try to want more from their employers. When they have satisfied with their survival needs, they attempt to achieve security needs. When jobs are protected, they will pursue ways of nourishing social needs and if successful, they will search for the resources to the ultimate end of self-actualization. The most significant associate of work satisfaction is retention. Workers who are all satisfied with their jobs incline to remain in their jobs, Nurses who are not satisfied with their job are found to be avoiding patients and their nursing responsibilities, which will spoil the quality of job, Exploring possible changes over time in sources of dissatisfaction discovered that issues related to the work environment rather than individual or demographic factors were still of furthestmost position to nurses turn over intentions.(<http://annalsofrscb.ro/>)

4.3 OBJECTIVES OF THE STUDY:

The current study is based on nurses' job satisfaction with the following objectives:

- To understand the job satisfaction
- To study job satisfaction of Nurses
- To assess relationship between demographic factors and job satisfaction of Nurses
- To identify the relationship between general satisfaction and various dimensions of job satisfaction of nurses working in hospitals.
- To examine level of job satisfaction and its nineteen dimensions among demographic characteristics.

4.4 FORMULATION OF HYPOTHESIS:

H1: There would be significant relationship between work experience and various dimensions of job satisfaction of nurses working in hospitals.

H0: There is no significant job satisfaction among BSc, general and diploma nurses.

4.5 SCOPE OF THE STUDY

The present study is thought to be an attempt which will help us to examine the role and operation of nurses and will provide a comparative study for the health department and other related research organizations.

The present study is confined to hukkeri taluka, through the sample of 66 female nurses from various hospitals as male nurse was found in the sample is 44. In this study, only female nurses were taken for the present study, This study highlights the impact of various variables / dimensions of job satisfaction on the overall job satisfaction of nurses in Through this study, the working conditions and other dimensions at the workplace and job satisfaction of the nursing community may be taken to be representative, in character to reflect the conditions of service of the nursing community in hukkeri taluka. The study has envisaged to access the socio economic conditions and affects of various factors of job satisfaction of nurses in hukkeri taluka and is expected to prove of great help to make policies for the welfare of nursing profession. On the other hand it will also help the health department to tackle at large the various problems of the nursing community.

4.6 RESEARCH METHODOLOGY

➤ Sample

The sample for the study consisted of 110 participants selected from the hospitals and clinics in Hukkeri taluka, belagavi district, and all 110 were nurses (both male and female).

➤ Inclusion criteria

Nurses who are working in hospitals and clinics in Hukkeri taluka, belagavi district of Karnataka are included in the study. People who are physically and mentally stable are included for study.

➤ Exclusion Criteria

Individuals other than the nursing profession are excluded from the study; people who weren't physically and mentally stable are excluded for study.

4.7 LIMITATIONS OF THE STUDY

➤ Nursing administration

Nursing administrators can plan measures to maintain job satisfaction of nurses. Specific job reinforcing factors like compensation and independence in which group have shown only average satisfaction can be more focused to changing nurses satisfaction from average to high level. Some measures recommended to improve job satisfaction with compensation are extra pay for extra working hours, periodical increment depending on performance of particular nurse. Seniority cum merit type promotion policy would help to improve satisfaction of nurses. Independence of nurses can be fostered with clear description of job of each cadre of nursing profession, nurses, diploma nurses, graduate nurses, master nurses etc, also by making clear demark able line between nursing and non-nursing activity.

- To maintain job satisfaction of nurses at high level following measures need to take in the organization
- Providing work as per interest of the person
- Appreciating good work done by individual in terms of words, awards, increments etc.
- Providing challengeable work by recognizing capacity and ability of each individual so that they can remain active all the time at work site.
- Seniority cum merit promotion policy can be adapted in order to give chance for advancement to nurses working in hospitals.
- Promoting leadership qualities among nurses and providing them opportunities to lead small projects in work settings.

CHAPTER-V

DATA ANALYSIS AND INTERPRETATION

In this chapter data analysis and data interpretation for the present study have been done. The study is based on the job satisfaction among nurses working hospitals of Hukkeri taluka.

Results of the study are presented by using statistical tools. Basic descriptive statistics as well as inferential statistics like Hypothesis by using software SPSS.

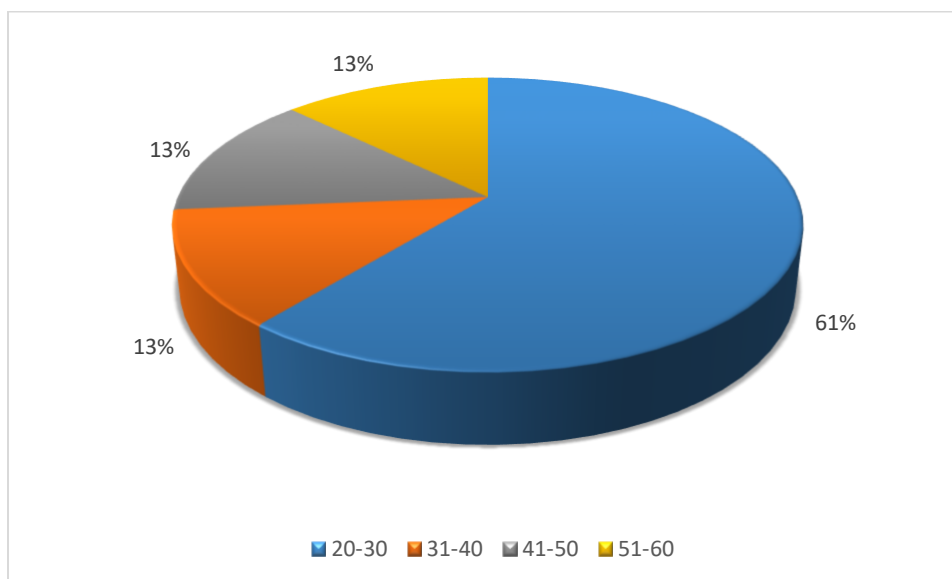

5.1 Demographic data:

Table No. 5.1 Age of the Nurses

Age	Frequency	Percent
20-30	67	61
31-40	14	13
41-50	15	13
51-60	14	13
Total	110	100

Source: Primary Data

Graph No. 5.1 Age of the Nurses

Source: Table No. 5.1

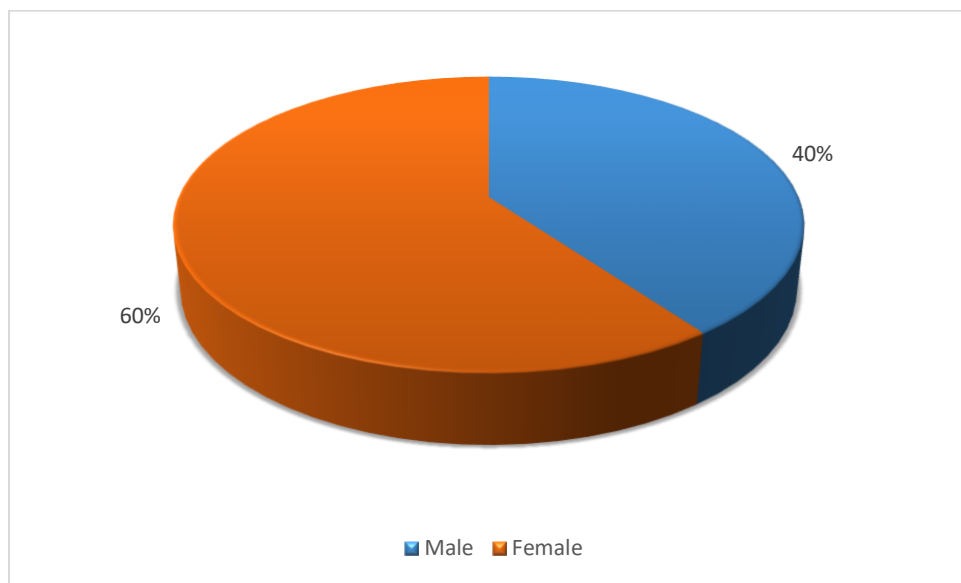

The above table and graph No 5.1 show that the majority 61 percent of individuals are aged 20–30, indicating a predominantly young population.

Table No. 5.2 Gender of the Nurses

Gender	Frequency	Percent
Male	44	40
Female	66	60
Total	110	100

Source: Primary Data

Graph No. 5.2 Gender of the Nurses

Source: Table No. 5.2

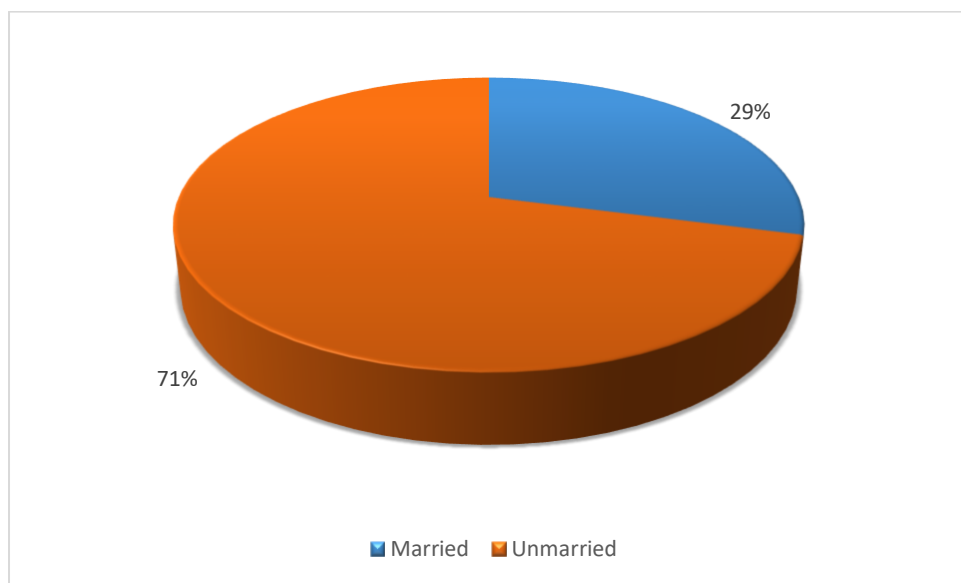

The above table and graph No 5.2 show that 60 percent of the participants are female 66 individuals, while 40 percent are male 44 individuals. This indicates a female-majority sample, which may influence the research outcomes, especially if gender plays a role in the variables being studied

Table No. 5.3 Marital Status of the Nurses

MS	Frequency	Percent
Married	32	29
Unmarried	78	71
Total	110	100

Source: Primary Data

Graph No. 5.3 Marital Status of the Nurses

Source: Table No: 5.3

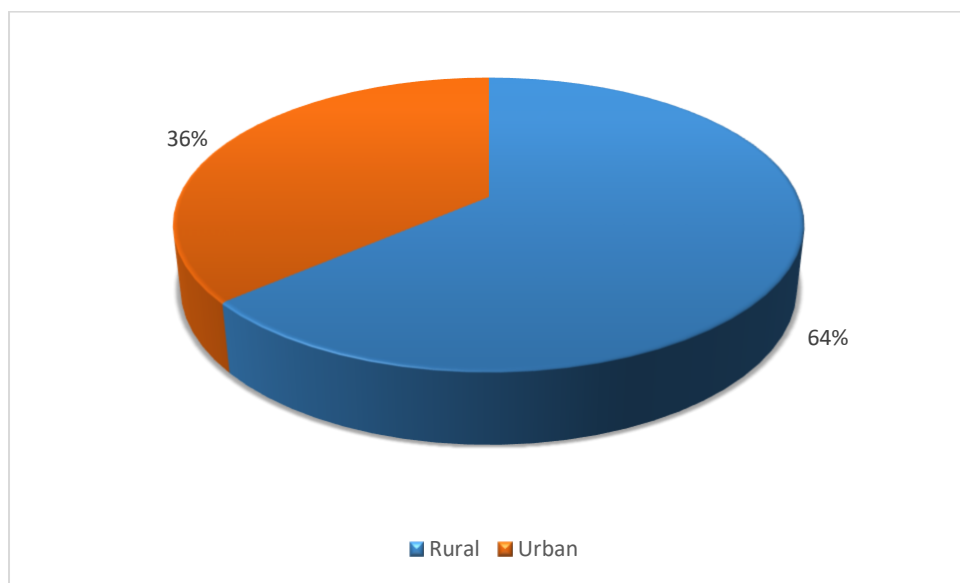

The above table and graph No 5.3 show that 71 percent of the participants are unmarried 78 individuals, while only 29 percent are married 32 individuals. This indicates that the sample is largely composed of unmarried individuals, Which may reflect a younger demographic and could influence the context and relevance of the research findings.

Table No. 5.4 Area belongs to Nurses

Area	Frequency	Percent
Rural	70	64
Urban	40	36
Total	110	100

Source: Primary Data

Graph No. 5.4 Area belongs to Nurses

Source: Table No. 5.4

The above table and graph No 5.4 show that 64 percent of participants are from rural areas 70 individuals, while 36 percent are from urban areas 40 individuals. This indicates a rural-majority sample,

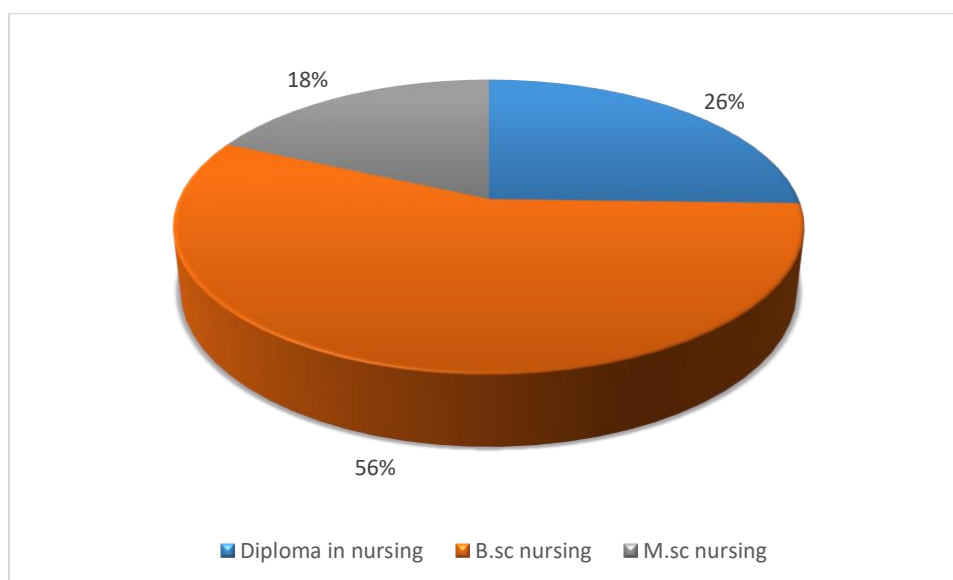

Which suggests that the research findings may be more reflective of rural perspectives, lifestyles, or challenges.

Table No. 5.5 Educational Qualification of the Nurses

EQ	Frequency	Percent
Diploma in nursing	28	26
B.sc nursing	62	56
M.sc nursing	20	18
Total	110	100

Source: Primary Data

Graph No. 5.5 Educational Qualification of the Nurses

Source: Table No. 5.5

The above table and graph No 5.5 show that the majority of participants hold a B.Sc. in Nursing 56 percent followed by Diploma in Nursing 26 percent, and M.Sc. in Nursing 18 percent.

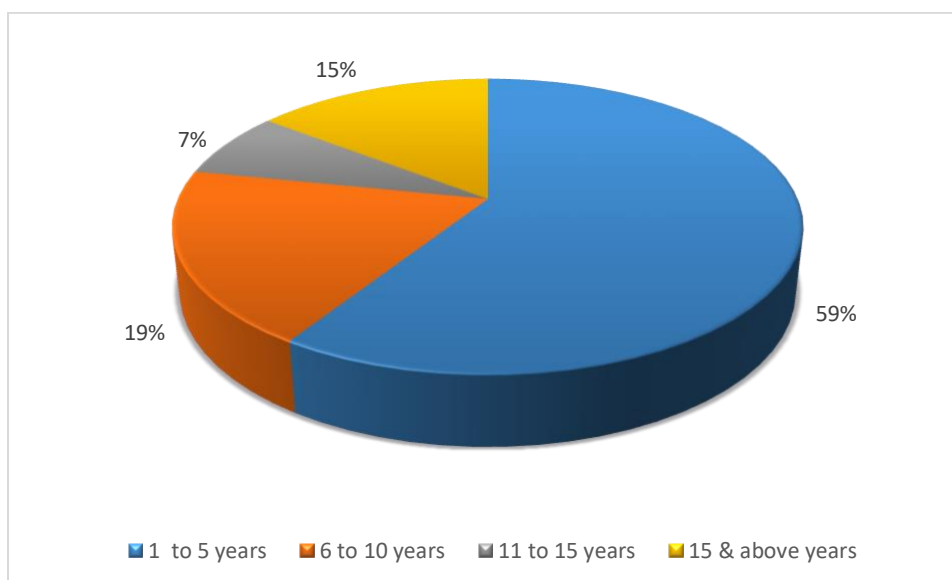

This indicates that the sample is predominantly composed of graduate-level nursing professionals, with a smaller proportion having postgraduate qualifications. This distribution may influence the level of clinical knowledge or experience reflected in the research.

Table No. 5.6 Experience of the Nurses

Work Experience	Frequency	Percent
1 to 5 years	65	59
6 to 10 years	21	19
11 to 15 years	8	7
15 & above years	16	15
Total	110	100

Source: Primary Data

Graph No. 5.6 Experience of the Nurses

Source: Table No. 5.6

The above table and graph No 5.6 show that indicates that the majority of participants 59 percent have 1 to 5 years of work experience. Smaller portions have 6 to 10 years 9 percent 15 years 15 percent and 11 to 15 years 7 percent indicating that more experienced professionals are underrepresented in the sample. This may influence the research outcomes, reflecting the perspectives of relatively less experienced individuals.

Suggesting a predominantly early-career workforce.

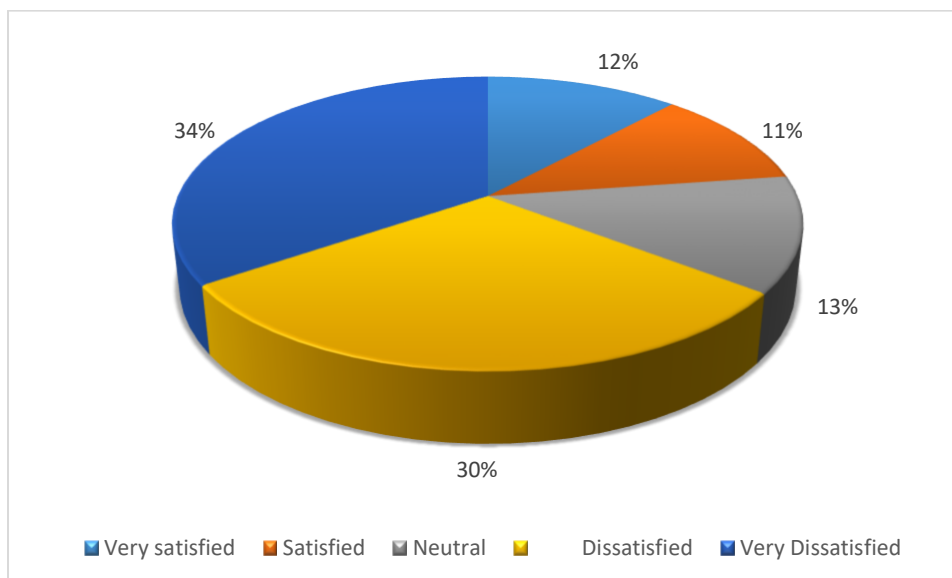

5.2 Job satisfaction

Table No. 5.7 The chance for service to others

Response	Frequency	Percent
Very satisfied	13	12
Satisfied	12	11
Neutral	14	13
Dissatisfied	33	30
Very Dissatisfied	38	34
Total	110	100

Source: Primary Data

Graph No. 5.7 The chance for service to others

Source: Table No. 5.7

The above table and graph No 5.7 show that a significant portion of participants are dissatisfied 30 percent or very dissatisfied 34 percent. Only 11 and 12 percent reported being satisfied or very satisfied, while 13 percent remained neutral.

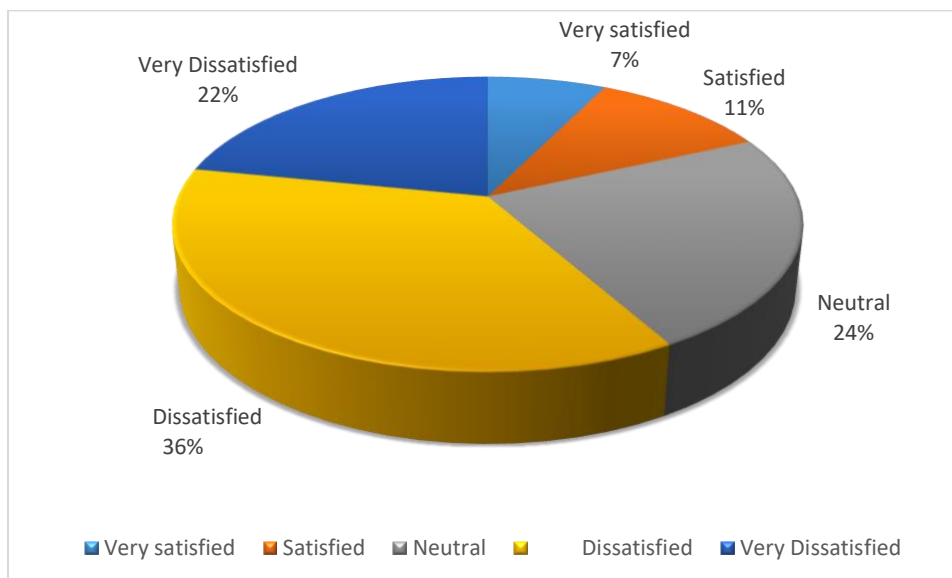

This indicates a generally negative perception or experience among participants, which may highlight areas needing urgent attention or improvement in the subject being studied.

Table No. 5.8 The chance to use some of my own ideas

Response	Frequency	Percent
Very satisfied	8	7
Satisfied	12	11
Neutral	26	24
Dissatisfied	40	36
Very Dissatisfied	24	22
Total	110	100

Source: Primary Data

Graph No. 5.8 The chance to use some of my own ideas

Source: Table No. 5.8

The above table and graph No 5.8 show that a large portion of participants are very dissatisfied with 36 percent and dissatisfied 22 percent, indicating a predominantly negative response. Only 11 and 7 percent reported being satisfied and very satisfied, while 24 percent remained neutral.

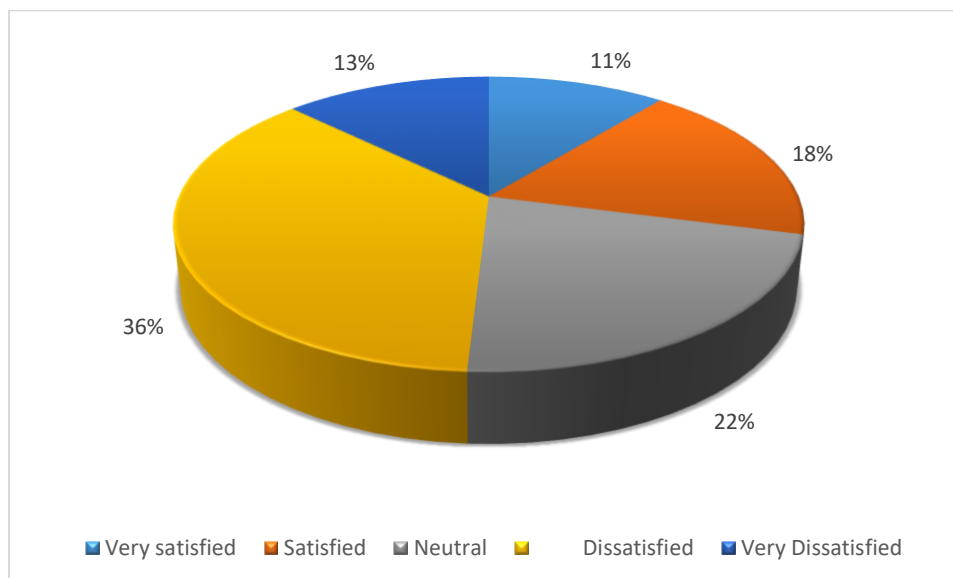

This suggests an overall dissatisfaction among participants, which may point to underlying issues that need to be addressed in the area being studied.

Table No. 5.9 Being able to do the job without feeling it is ethically wrong

Response	Frequency	Percent
Very satisfied	12	11
Satisfied	20	18
Neutral	24	22
Dissatisfied	40	36
Very Dissatisfied	14	13
Total	110	100

Source: Primary Data

Graph No. 5.9 Being able to do the job without feeling it is ethically wrong

Source: Table No. 5.9

The above table and graph No 5.9 show that majority of respondents with 36 percent being Dissatisfied and 13 percent Very Dissatisfied. Only 29 percent reported being satisfied or very satisfied, while 22 percent remained neutral.

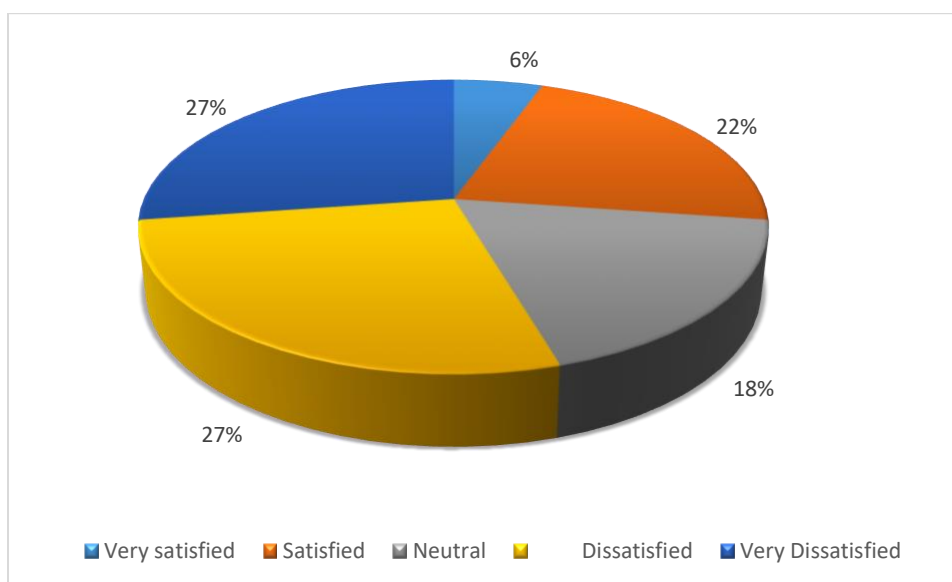

This indicates a generally negative sentiment toward the subject surveyed.

Table No. 5.10 The chance to do work herself

Response	Frequency	Percent
Very satisfied	6	6
Satisfied	24	22
Neutral	20	18
Dissatisfied	30	27
Very Dissatisfied	30	27
Total	110	100

Source: Primary Data

Graph No. 5.10 The chance to do work herself

Source: Table No. 5.10

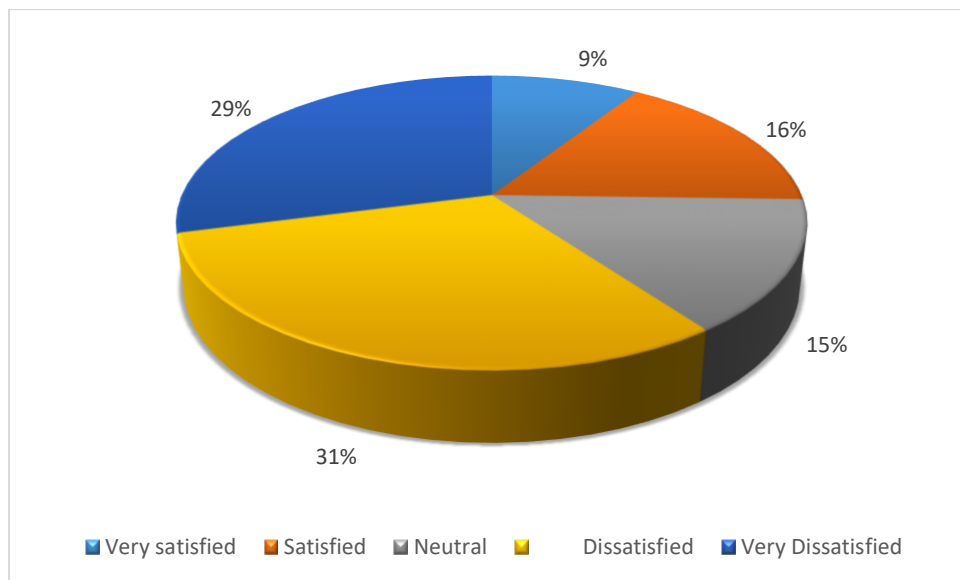

The above table and graph No 5.10 show that survey, respondents are 27 percent Dissatisfied 27 percent Very Dissatisfied, indicating a strong negative sentiment. Only 28 percent expressed satisfaction, while 18 percent remained neutral. Suggesting that improvements may be needed to address the concerns of the majority.

Table No. 5.11 The variety in my work

Response	Frequency	Percent
Very satisfied	10	9
Satisfied	18	16
Neutral	16	15
Dissatisfied	34	31
Very Dissatisfied	32	29
Total	110	100

Source: Primary Data

Graph No. 5.11 The variety in my work

Source: Table No. 5.11

The above table and graph No 5.11 show that significant majority of respondents 31 percent Dissatisfied and 29 percent Very Dissatisfied, reflecting a predominantly negative perception. Only 25 percent expressed satisfaction, and 15 percent remained neutral.

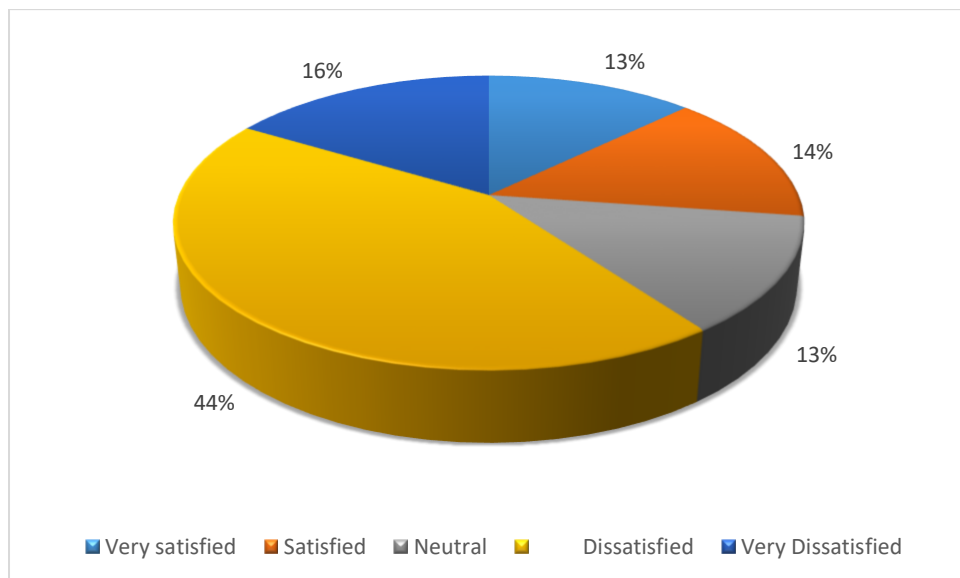

Indicating a clear need for improvement in the area surveyed.

Table No. 5.12 The chance of workers look to me for directions

Response	Frequency	Percent
Very satisfied	14	13
Satisfied	16	14
Neutral	14	13
Dissatisfied	48	44
Very Dissatisfied	18	16
Total	110	100

Source: Primary Data

Graph No. 5.12 The chance of workers looks to me for directions

Source: Table No. 5.12

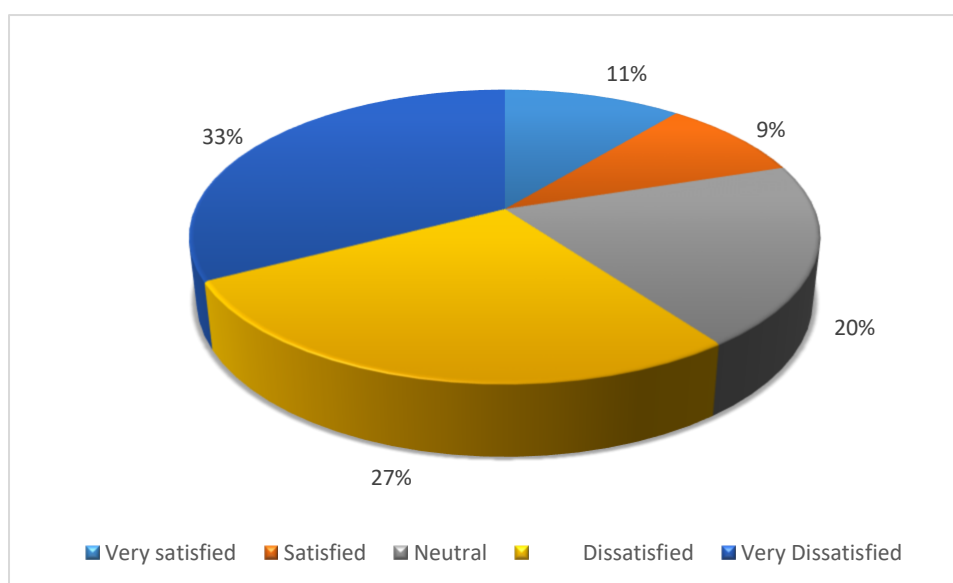

The above table and graph No 5.12 show that survey shows that with 44 percent Dissatisfied and 16 percent Very Dissatisfied, indicating a strong negative sentiment. Only 27 percent reported satisfaction, while 13 percent were neutral, Suggesting a need for significant improvements.

Table No. 5.13 The chance to do the type of work that I do best

Response	Frequency	Percent
Very satisfied	12	11
Satisfied	10	9
Neutral	22	20
Dissatisfied	30	27
Very Dissatisfied	36	33
Total	110	100

Source: Primary Data

Graph No. 5.13 The chance to do the type of work, that I do best

Source: Table No. 5.13

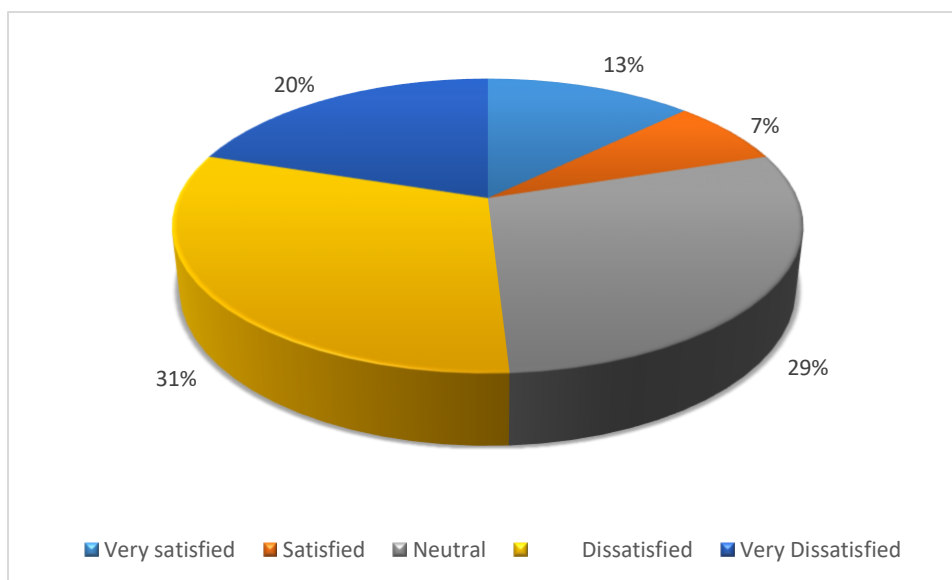

The above table and graph No 5.13 show that 27 percent Dissatisfied and 33 percent Very Dissatisfied, indicating a strong negative perception. Only 20 percent reported satisfaction, while 20 percent remained neutral, Highlighting a clear area of concern that may require attention.

Table No. 5.14 The social status in society due to this job

Response	Frequency	Percent
Very satisfied	14	13
Satisfied	8	7
Neutral	32	29
Dissatisfied	34	31
Very Dissatisfied	22	20
Total	110	100

Source: Primary Data

Graph No. 5.14 The social status in society due to this job

Source: Table No. 5.14

The above table and graph No 5.14 show that 31 percent of respondents are dissatisfied, while only 20 percent reported satisfaction. A significant portion 29 percent remained neutral.

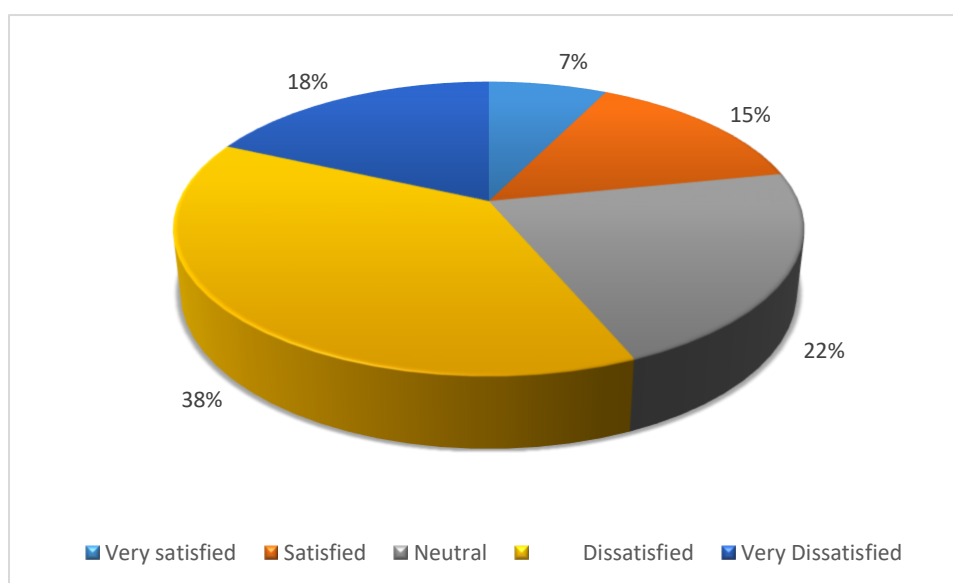

Suggesting mixed feelings but with a clear lean toward dissatisfaction overall.

Table No. 5.15 The policies and practices toward nurses in the hospital

Response	Frequency	Percent
Very satisfied	8	7
Satisfied	16	15
Neutral	24	22
Dissatisfied	42	38
Very Dissatisfied	20	18
Total	110	100

Source: Primary Data

Graph No. 5.15 The policies and practices toward nurses in the hospital

Source: Table No. 5.15

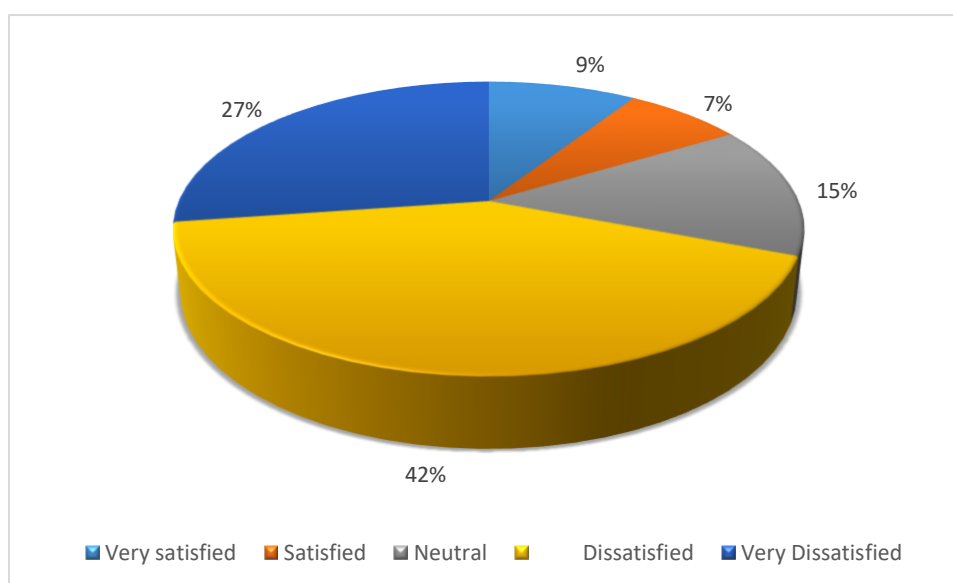

The above table and graph No 5.15 table show that majority of respondents with 38 percent Dissatisfied and 18 percent Very Dissatisfied indicating a generally negative sentiment. Only 22 percent reported satisfaction, while 22 percent remained neutral, Suggesting a need for improvement in the area assessed.

Table No. 5.16 The way my superior and I understand each other

Response	Frequency	Percent
Very satisfied	10	9
Satisfied	8	7
Neutral	16	15
Dissatisfied	46	42
Very Dissatisfied	30	27
Total	110	100

Source: Primary Data

Graph No. 5.16 The way my superior and I understand each other

Source: Table No. 5.16

The above table and graph No 5.16 show that results reveal a strong negative sentiment, with 42 percent Dissatisfied and 27 percent Very Dissatisfied Only 16 percent reported satisfaction, while 15 percent were neutral.

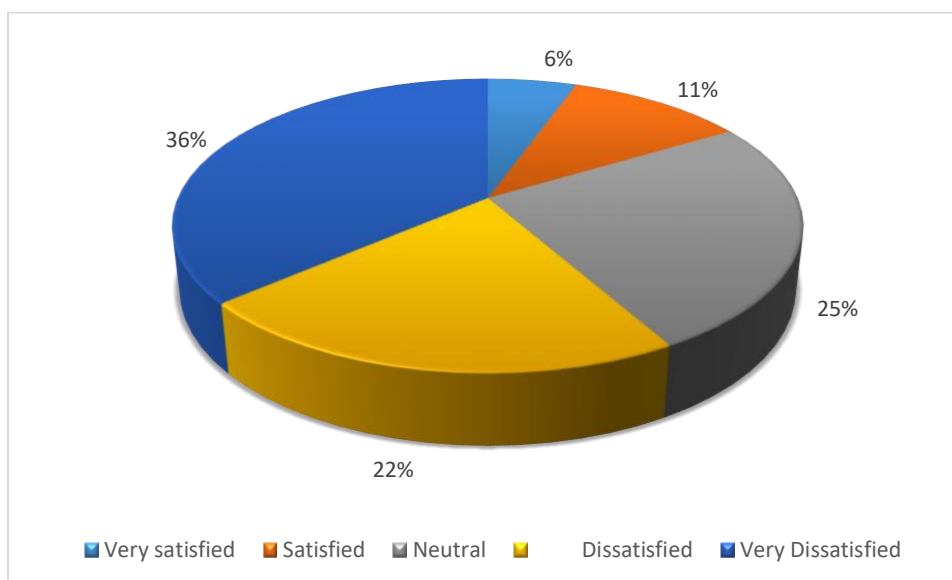

Indicating a clear need for improvement in the area evaluated.

Table No. 5.17 Job security

Response	Frequency	Percent

Source: Primary Data

Graph No. 5.25 Being able to see the outcome of the work I do

Source: Table No. 5.25

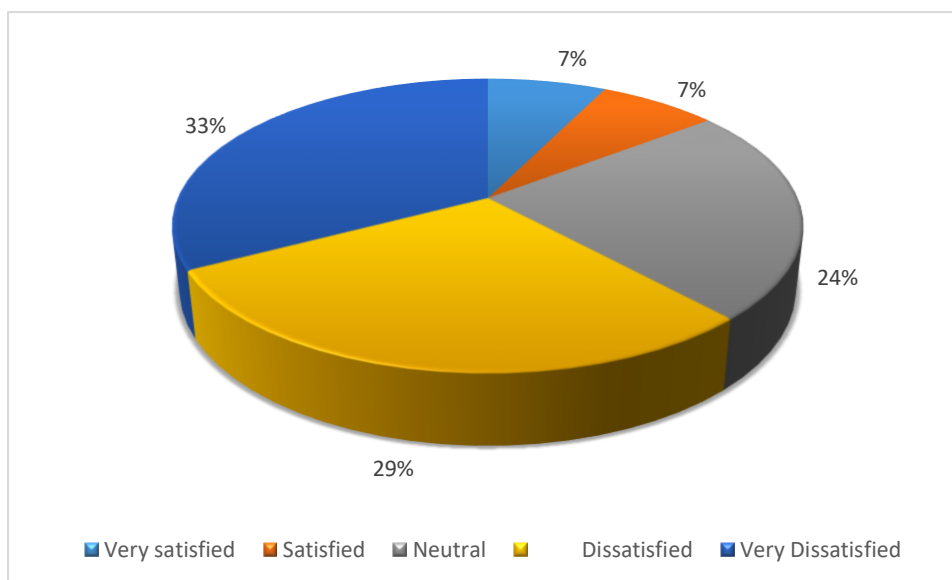

The above table and graph No 5.25 show that survey indicates that 35 Percent of respondents are dissatisfied, while only 19 percent expressed satisfaction. With 24 percent neutral, the overall sentiment leans toward dissatisfaction. suggesting areas that may require attention and improvement.

Table No. 5.26 The chance to be active much of the time

Response	Frequency	Percent
Very satisfied	8	7
Satisfied	8	7
Neutral	26	24
Dissatisfied	32	29
Very Dissatisfied	36	33
Total	110	100

Source: Primary Data

Graph No. 5.26 The chance to be active much of the time

Source: Table No. 5.26

The above table and graph No 5.26 show that 29 percent of respondents are Dissatisfied, and 33 Percent Very Dissatisfied. Only 7 percent reported satisfied and 7 percent very satisfied, while 24 percent remained neutral, indicating a generally negative perception.

5.2 Hypothesis Testing

ANOVA					
Satisfaction					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	2851.576	2	1425.788	5.894	.004
Within Groups	25884.142	107	241.908		
Total	28735.718	109			

The above one-way table value 5.894 and $0.004 < 0.05$ shows that there is a relationship between the work experience of the nurses and their job satisfaction. The null hypothesis i.e. There is no significant job satisfaction among BSc, general and diploma nurses. Has been rejected at the 95 percent of confidence level.

CHAPTER VI

FINDINGS, SUGGESTIONS & CONCLUSION

6.1 Findings

- The majority of the participants 61 percent are in the 20-30 age group, while the other age groups 31-40, 41-50, and 51-60 each represent 13 percent of the sample.
- The majority of participants are female 60 percent, while males make up 40 percent of the sample.
- The majority i.e. 71 percent are unmarried.
- The findings show that 64 percent of respondents are from rural areas, while 36 percent are from urban areas.
- The findings show that most respondents 56 percent hold a B.Sc. Nursing qualification, followed by 26 percent with a Diploma in Nursing and 18 percent with an M.Sc. Nursing.
- The findings show that most respondents 59 percent have 1 to 5 years of work experience, while fewer have longer experience levels.
- The findings show that most respondents are dissatisfied 30% or very dissatisfied 34 percent, indicating a generally negative level of satisfaction.
- The findings show that most respondents are dissatisfied 36 percent, followed by 24 percent who are neutral, indicating an overall negative satisfaction trend.
- The findings show that most respondents 36 percent are dissatisfied, while fewer are satisfied 18 percent or very satisfied 11 percent indicating a generally low satisfaction level.
- The findings show that most respondents are dissatisfied 27 percent or very dissatisfied 27 percent, indicating an overall negative satisfaction level.
- The findings show that most respondents are dissatisfied 31 percent or very dissatisfied 29 percent, reflecting a generally negative satisfaction level.
- Most respondents 60 percent are dissatisfied or very dissatisfied, while only a small portion 27 percent feel satisfied or very satisfied, indicating overall discontent.
- Most respondents' 60 percent expressed dissatisfaction, with very few 20 percent feeling satisfied, highlighting a strong sense of discontent overall.

- Responses are quite mixed, but a significant portion 51 percent feel dissatisfied, while only 20 percent are satisfied, showing overall moderate discontent with many remaining neutral.
- A large portion of respondents 56 percent are dissatisfied, while only 22 percent feel satisfied, indicating overall negative sentiment with a notable number remaining neutral.
- Most respondents 69 percent are dissatisfied or very dissatisfied, while only 16 percent feel satisfied, reflecting a strong overall dissatisfaction.
- Most respondents' 58 percent are dissatisfied or very dissatisfied, while only 17 percent feel satisfied, showing a clear trend of dissatisfaction with some neutrality.
- Responses are balanced, but slightly more respondents 45 percent are satisfied or very satisfied compared to 42 percent who are dissatisfied, indicating a mixed but slightly positive sentiment overall.
- Most respondents 54 percent are dissatisfied or very dissatisfied, while only 19 percent feel satisfied, reflecting overall negative sentiment with many remaining neutral.
- Responses show an even split, but slightly more respondent's 54 percent are dissatisfied or very dissatisfied, compared to 24 percent who are satisfied, indicating overall mild dissatisfaction.
- While a significant portion 33 percent remain neutral, more respondent's 42 percent are dissatisfied or very dissatisfied compared to 25 percent who are satisfied, showing a tendency toward mild dissatisfaction.
- A notable portion of respondents 51 percent are dissatisfied or very dissatisfied, while only 25 percent feel satisfied, indicating overall negative sentiment with some neutrality.
- Most respondents' 62 percent are dissatisfied or very dissatisfied, while only 22 percent feel satisfied, highlighting a strong overall dissatisfaction.
- Most respondents' 60 percent are dissatisfied or very dissatisfied, while only 22 percent feel satisfied, indicating overall negative sentiment despite some satisfaction.
- Most respondents' 57 percent are dissatisfied or very dissatisfied, while only 19 percent feel satisfied, reflecting overall negative sentiment with a notable neutral group.

- Most respondents' 62 percent are dissatisfied or very dissatisfied, while only 14 percent feel satisfied, indicating a strong overall negative sentiment.

6.2 SUGGESTIONS

1. **Improve Overall Job Satisfaction** Most respondents are unhappy with their current situation. It's important to find out why and take action. Conduct surveys or discussions to identify key issues such as workload, recognition, career growth.
2. **Support Career Growth and Learning** Many employees have B.Sc. Nursing qualifications and 1–5 years of experience. Offering training programs, mentorship, and clear career paths will help them grow, feel valued, and stay motivated.
3. **Consider Age and Gender Needs** Since most respondents are young 20–30 years and female, workplaces should focus on flexible schedules, work-life balance, and supportive policies like maternity benefits and safety measures.
4. **Address Rural-Urban Differences** A majority of respondents come from rural areas. Providing extra support such as transport allowances, skill development opportunities.
5. **Monitor Satisfaction Regularly** Conduct regular check-ins, surveys, or feedback sessions to track satisfaction levels. Use this data to identify trends and respond quickly to concerns before they grow into bigger issues.
6. **Promote Well-being and Retention** Offer wellness programs, stress management workshops, and mental health support.
7. **Further Research Opportunities** Future studies could explore the reasons behind dissatisfaction more deeply through interviews or focus groups, or examine how factors like age, education, or location affect satisfaction and performance.

6.3 Conclusion

Study reveal that a significant number of employees are experiencing dissatisfaction, particularly among younger, female, and rural staff. While some remain neutral or moderately satisfied, the overall trend points toward a need for improvement in workplace conditions, recognition, and career growth opportunities. Education and experience play a role in shaping expectations, and interventions such as skill development, supportive policies, and well-being initiatives can help address concerns. In essence, creating a positive, inclusive, and growth-oriented work environment is key to boosting satisfaction, motivation, and overall productivity among employees. By listening to their needs and taking meaningful action, organizations can turn dissatisfaction into engagement and build a stronger, happier workforce.
